

# VanderPas **Feeding System**

## General information

The ***VanderPas feeding system*** feeds goats both automatically and individually.

Providing feed concentrate is very labour-intensive and time-consuming. Changing to an automatic feeding system can also improve operating results.

The ***VanderPas feeding system*** feeds based on need.

**This can result in:**
- increased production
- decreased feed consumption
- healthier goats

Obviously, these effects will depend on the current situation at your dairy farm.

Provides feed concentrate both **automatically** and **individually**

## Its design

The use of the ***VanderPas feeding system*** can make more efficient use of the stall's floor surface. After all, since the feeding system is in operation 24 hours a day, not all of the goats will have to feed at the same time, and this means less space occupied by the feed alley. These square metres can then be used as extra resting / activity space.

If a zoning plan or a lack of space on the existing premises makes building a new stall or expanding an existing one impossible, this is an opportunity to still be able to accommodate more goats.

The dimensions of the ***VanderPas feeding system*** (3 m wide, 14 m long) make it perfect for integrating into an existing stall. It will not get in the way of mucking out!

The basic version can provide three different kinds of feed. Adding yet another kind of feed is optional.

The feeding system is controlled by its EGAM feeding module. In addition, the ***VanderPas feeding system*** is equipped with a software programme used to adjust and read out feeding data such as daily and individual goat summaries.
The quantity of each kind of feed concentrate is weighed for each goat every time it visits the feed alley! This is the most accurate method of gathering this information.

Sixty goats can feed at the same time. Since the system is in operation 24 hours a day, it can feed 1500 dairy goats.

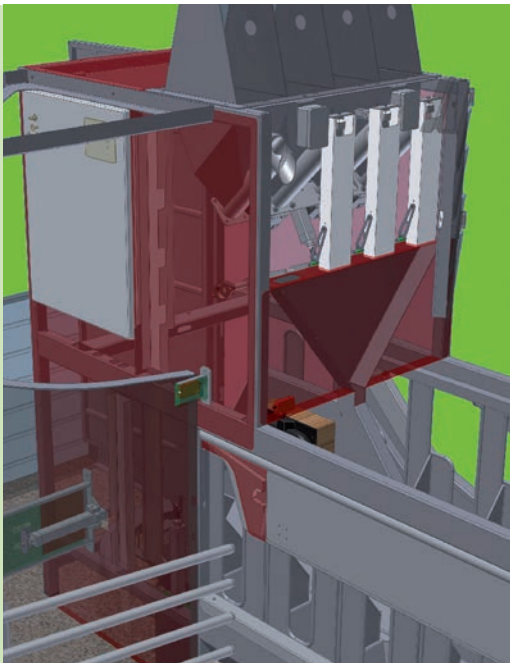

## A plug-in system

It takes only one day to install the ***VanderPas feeding system*** and make it operational! This is possible when the buyer/dairy farmer will already have made certain changes in the stall in consultation with Geitenbelang.

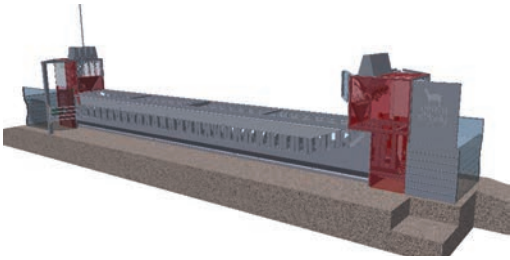

## Maintenance

The ***VanderPas feeding system*** is practically maintenance-free! Its energy consumption is exceptionally low. Software support is provided remotely by means of an internet connection. All of this ensures a highly reliable system.

*The drawing shown here gives an idea of the feeding system. An impression of how it works is available at www.geitenbelang.nl*
